Alert Detail

Medium	Buffer Overflow
Description	Buffer overflow errors are characterized by the overwriting of memory spaces of the background web process, which should have never been modified intentionally or unintentionally. Overwriting values of the IP (Instruction Pointer), BP (Base Pointer) and other registers causes exceptions, segmentation faults, and other process errors to occur. Usually these errors end execution of the application in an unexpected way.

Evidence	Connection: close
Other Info	Potential Buffer Overflow. The script closed the connection and threw a 500 Internal Server Error.
Instances	2
Solution	Rewrite the background program using proper return length checking. This will require a recompile of the background executable.

Low	Application Error Disclosure
Description	This page contains an error/warning message that may disclose sensitive information like the location of the file that produced the unhandled exception. This information can be used to launch further attacks against the web application. The alert could be a false positive if the error message is found inside a documentation page.

Solution	<p>Ensure that the application/web server sets the Cross-Origin-Resource-Policy header appropriately, and that it sets the Cross-Origin-Resource-Policy header to 'same-origin' for all web pages.</p> <p>'same-site' is considered as less secured and should be avoided.</p> <p>If resources must be shared, set the header to 'cross-origin'.</p> <p>If possible, ensure that the end user uses a standards-compliant and modern web browser that supports the Cross-Origin-Resource-Policy header (https://caniuse.com/mdn-http_headers_cross-origin-resource-policy).</p>
